LUCAS NKUTA

FULL-STACK SOFTWARE ENGINEER | TYPESCRIPT, REACT AND AWS

mwelwankuta@gmail.com | github.com/mwenku | linkedin.com/in/mwelwa

SUMMARY

Full-stack engineer with over five years of experience across fintech, payments, and data-driven products. My background spans early-stage startups, founding engineering roles, and software engineering consulting, with both remote and onsite teams. Across these roles, I have worked with different engineering teams and approaches to building software, from creating products from scratch to scaling and maintaining production systems.

EXPERIENCE

Software Engineer

Sep 2025 to Present

ChitChat (Union54) | YC S21, *London, United Kingdom*

Consumer and Business fintech covering multi-currency wallets, physical and virtual cards and remittances. Worked across wallet, identity, partner, and reporting services using TypeScript and AWS CDK, Lambda, DynamoDB, SQS, and EventBridge & SQL. Was main point of contact between the finance and development teams

- **Implemented Mastercard Cross-Border Services integration** by extending the Transfast client with payload encryption, OAuth request signing, payout-limit handling and bank-branch support. Built certificate-checked status callbacks with conditional updates, optimistic locking, duplicate-event handling, and sensitive-data redaction.
- **Built Sub-Wallets across identity and wallet services**, covering onboarding, access controls, atomic transfers, transaction history and statements, physical card ordering and activation, and subscription billing. Added payment reminders, renewal and cancellation, repeated-charge safeguards, and card restrictions. Also contributed to the mobile frontend for Sub-Wallets.
- **Revived and Extended the partner platform** with tenant-scoped user, card, transaction, and configuration APIs and API-key rotation. Added signed KYC and 3DS OTP webhooks with retries and OTP email fallback. Implemented transaction, card-termination, and recurring fees, including payment scheduling and regression checks for fee transactions and balances.
- **Extended multi-currency card processing and fraud controls**, adding EUR wallet creation, authorization holds, fees, settlement, and reversal scenarios. Carried ZMW funding, USD refunds, and FX details through APIs, statements, and reports. Persisted fraud triggers and freeze reasons, restricted inappropriate unfreezing, and expanded card-deposit diagnostics.
- **Integrated Bridge as a stablecoin deposit provider for USDT over Ethereum**, covering deposit sessions, idempotency keys, signed webhooks, conditional wallet credits, and customer notifications. Also implemented React Native stablecoin deposit-session creation and response handling.
- **Integrated Google Shared Drive delivery across upwards of 20 existing finance and operating report handlers**, and built settlement, cross-currency refund, and pickup-agent reports. Extended DynamoDB-to-Aurora persistence and enhanced daily card reporting with historical FX and fee reconstruction and consistent CSV output.
- **Developed monthly mobile-money and peer-to-peer levy-return reporting**, alongside financial-access and unclaimed-funds reports. Implemented reporting-period rules, Zambia-specific identification selection, report generation, and operational notifications.
- **Extended the React and Next.js CRM** with tenant switching, persisted organization context, tenant-scoped queries, and shared access guards. Added corporate-user listings, account-creation forms, TPIN editing, reset-email and temporary-passcode workflows, and transaction details for support investigations.
- **Implemented wallet transaction-limit visibility across the backend and React Native client**, exposing limits, rolling usage, remaining allowances, and reset times. Added currency selection, retry handling, and service tests, and refined mobile card-deposit selection, payment-screen layouts, and mobile-money phone inputs.
- **Extended group-wallet payments into Stream Chat** with transaction attachments, sender and payment context, optional notes, and notification deep links. Isolated chat-delivery failures so they do not abort an already-processed wallet top-up.
- **Improved testing and release workflows across services** through unit, integration, and end-to-end scenarios, reusable partner and API-key provisioning, regression pipelines, and automated API documentation publishing. Updated runtime and test tooling and contributed to trunk-based development, semantic releases, and peer review.

Software Engineering Consultant
Jul 2024 to Aug 2025

The Zig Group, Inc., *Seattle, Washington, USA*

A Data and AI Engineering consulting firm with the majority of its clients across the United States. thezig.io

- **Expanded Aiponics from B2B into B2C** through backend features and integration with AfriDelivery's AfriFresh, supporting over $1 million in annual GMV.
- **Automated 90% of B2B ordering workflows,** enabling the team to serve a larger client base, reduce annual costs, and scale operations.
- **Deployed predictive analytics visualizations across 200+ Breeze Autocare locations** in the United States**,** improving purchasing decisions and delivering yearly efficiency gains in inventory management.
- **Led and mentored 6+ data engineering, analytics, and AI interns,** providing technical guidance and project oversight; four received return offers

Founding Software Engineer
May 2023 to Aug 2024

Shop & Smile, *Brussels, Belgium*

Distributed point-of-sale SaaS for merchant operations, with a TypeScript serverless backend and Flutter app.

- **Built TypeScript serverless backend infrastructure** for inventory templates, purchase orders, customer management, reporting, and merchant notifications.
- **Contributed to the cross-platform application and POS platform,** supporting merchants across inventory, suppliers, payments, discounts, receipts, and tax compliance.
- **Contributed to the implementation of a type-safe event-driven system** on AWS and migrated several services to a faster deployment tool, which cut down overall deployment times significantly (60x)

Founding Software Engineer
Feb 2021 to Dec 2023

Bwangu Delivery, *Lusaka, Zambia*

- **Led development and deployment of three React Native apps** for a bootstrapped logistics startup that included customer ordering, rider management, and front-office operations, together with PHP REST APIs and supporting infrastructure for all mobile and web applications that supported over 10,000 B2C orders in the first year of launching

TECHNICAL SKILLS

Languages TypeScript, JavaScript, Go, Python, SQL

Frontend React, Next.js, React Native, Angular, Vite, TailwindCSS

Backend Node.js, NestJS, Express.js, Middy, REST, GraphQL, Zod, OpenAPI,

Data DynamoDB(single-table design & GSI modelling), Aurora, PostgreSQL, SQL Server, MySQL, Redis, Prisma, MongoDB

AWS CDK, Lambda, API Gateway, SQS, EventBridge, S3, EC2, CloudWatch, Cognito, QuickSight

Testing and delivery Jest, unit, integration and end-to-end tests, Bitbucket Pipelines, GitHub Actions, semantic-release, Docker, CI/CD

Practices Event-driven microservices, tenant isolation, idempotent jobs, optimistic locking, signed webhooks, code review

PROJECTS

Raven www.useraven.xyz Message forwarding into users' preferred messaging apps, built with Go, TypeScript, Docker, AWS EC2, Prisma, SQL, and Redis.

Fleetle fleetle.app Vehicle telemetry using LTE-enabled OBD scanners and Go and TypeScript services for live diagnostics, trip tracking, and vehicle health monitoring.

Evoke evoke.black Bootstrapped event discovery and ticketing with a live crowd heatmap; reached 200+ ticket sales in the first week of launch and over 5,000 to date

Songo Music Game songomusicgame.com Music quiz for solo and offline+online multiplayer play, with over 2,000 monthly active users at launch
